

# Life Cycle of A Star

Cut out each of the labels and attach it to the appropriate stage. Then color the star at each stage.

<p>A cloud of gases and dust comes together in space</p>	<p>The new star gives off light and heat.</p>	<p>The cooler outside layers start to drift off into space.</p>
<p>In the center of the cloud a star forms.</p>	<p>The outside layers of the star move outward and start to cool off. This is a red giant.</p>	<p>The star becomes a white dwarf that will keep getting cooler and darker over time.</p>
